<u>Group 1</u>

web7 is movie community online. In their home page, it provide many interesting contents such as popular movie, now playing, latest review, popular review. If we do not signin then we can only view their homepage that offer list of movies. They require email, username and password for registration. After that we signin then it offer many services. For example search function, all review,comment and create, edit, delete new topic of movie. Moreover, this website has video for show title of movie. It make us relax and excited.

This website has a good design. Their use black background and has many image then it look mysterious and compelling for our group. We understand easily what is they did and what they tried to provide because they use big font of topic which is most important such as popular movie, now showing and small format which information not significant such as name of account

and log out.

However, some functions not available yet such as search function , link of people on above website, generate report. Other things that should modify follow as

 We can change information of other users. Normally, when we view topic of other people then-

we should not edit that information.

 We can use same emails sign up more than one time.-

 We think web7 should block empty comment or show warning message.-

Group 2

We, group2 members, would like to give some comments for your website's improvement as follows:

1. In editing movie page, input fields are too close to left margin. They should be placed about 1 inch or so away from the margin.

2. Your website design is good but table design needs to be a bit more attractive.

3. Your website security is weak. Users can edit movies without logging in or signing up your website. Such bug should be fixed.

4. Data model

    a. Not sure if the limitation of specific number of characters on fields in tables like varchar(100), varchar(200) is good enough. Usually, in ruby model, the fields with string have length 255

Group 3

Here our suggestion that we think would improve your system

1. The comment might need to become bigger, also the enter button submits it when we pressed enter key, probably is better when pressing enter will go to a new line instead.

2. We are able to edit the reviews of other users, maybe is just not yet complete, if it is then please disregard this comment.

Group 4

We sent the feed back about your websites.

Web7 Movie diary
This website contains information about movies.
Data Model- The data model of web7 is sufficient for your project.But
sorting by date and popular are not working. Neither is People.
auth+auth- We can sign up without entering a password confirmation. We can also add a blank comment.
Look and Feel-This website is user-friendly and attractive. Website template is nice.

Critic from outside of class (Base on three persons)

1. When they review our home page, they say the black background is really cool but the font color grey sucks.

2. Make the review and entry look more pretty.
3. When they go to review, they want to see the poster of the movie and click on movie will go to movie info page.
4. If they write a review, the comment section and main review section look similar, at least make the comment font size smaller.
5. In profile page, change profile image line ugly.
6. Why are we providing access to every user to allow editing the movie information?
7. and also why can I edit my friend post?
8. We want to see movie link to watch freely online too, will you provide?

Group 5

Data Model – The data model of group Web07, most of tables' information is already fine. Having just some tables may not have enough information liked user (this should contain personal information of user).

Auth+Auth – The authentication seems to be not fine for me. However, this should have more information about user not just only username, password, and email. This should contain personal information.

Look and Feel – The design of project is quite nice. However, some pages, they should finish transaction within that page liked changing profile image, view details of movie and like movies. For the last one, this should implement without loading much.

Navigation – For navigation of this project, this's clear and easy to use for that. So, this case, I don't have any problems with that.

Functionality – For functionality, most of them are about script and design. Javascript you used, it sometimes works and sometimes doesn't work. And about design, home page which show gallery of movies, when you hover your mouse on that thumbnail, some links will show. Layout of that, it should be center of that image. It will be better. And adding new entry, for my opinion, I think that it's not necessary for this page. If you wanna use that, you should use with search function.

Brief Summary

(+) Black-White theme is appropriate for this website. It look mysterious and can get along well with all content type.

(+) Content is interesting , we provide basic information about movie such as overview and release date. We also have poster picture and trailer of movie which make user feel interesting .These not only make out web informative but also make our page look beautiful.

(+) Authentication in work well execpt one issue, user can user same emails sign up more than one time.

(+) User can easily understand how to user our web.

(-) The textfield ,that we use for create new review and comment, can insert only text with 1 line with out enter. Some users are want to insert multiple lines or picture for create their review.

(-) There are some issues about security and data constrain in our page such as prevent empty comment, role for user to edit content and alert page etc.

(-) Javascript is not stable

(-) Many functions and style are not finish

Action plan

- Finish all function.

- Finish all style.

- Can insert HTML such as image tag ,font style and hyperlink etc. in textfield.

- Have strategy to make user stay in our web longer such as show recommended movie or show related movie.
